Product release ► SignServer 3.1.3

3 June 2010 - Stockholm, Sweden

The PrimeKey SignServer team is happy to announce that SignServer 3.1.3 has been released! This is a maintenance release – in total 9 features, options, bugs and stabilizations have been fixed or added. The most noteworthy changes can be seen below.

Development continues beyond this version and all requests from the community [1] are scheduled for SignServer 3.1.4 or later releases.

More information is available at the project web site [2] and the complete changelog can be viewed in the issue tracker [3].

SignServer 3.1.3 Release Notes ►

● **New features and improvements:**

  ➢ Counter limiting the number of signatures before key renewal requirement.

  ➢ Service that periodically writes current values of key usage counters and signer validity to file.

  ➢ Support for workers dispatching requests to other worker(s).

  ➢ Prints SignServer version at startup.

  ➢ Unit test for checking validity using PrivateKeyUsagePeriod.

● **Bug fixes:**

  ➢ Correct filename is now returned when using IE6.

  ➢ Displaying signing certificate for MRTDSODSigner now works for soft cryptotokens.

  ➢ Check signer validity periods now also works for soft cryptotokens.

PrimeKey Solutions AB

PrimeKey is the world's leading open source PKI (public key infrastructure) company, founder and commercial force behind some of the most downloaded open source PKI projects - EJBCA and SignServer.

As an open source security software pioneer, PrimeKey provides enterprise class solutions to key public and commercial sector clients worldwide. Organizations turn to PrimeKey's open source software platforms to implement security solutions (e-passports, product authenticity, document signing, digital signatures, unified digital identities etc.) and their associated high speed and high availability validation.

PrimeKey's enterprise class integration, training and support services and dedication to open standards, help customers achieve their organizational goals. www.primekey.se

The SignServer project

SignServer is a server-side framework that operates on behalf of business applications. It is designed to perform automated signatures and other cryptographic operations on digital documents. The server uses plug-ins for standard and customer specific applications and can be clustered for high availability.

SignServer is intended for use in environments where local key protection is not sufficient or local signature operations are not suitable. There are standard modules for signing of time stamps (RFC 3161 compliant) and documents (PDF, ePassport, XML, ODF and OOXML) and also for validation of signed documents. www.signserver.org
